## 1. General

Air and moisture sensitive reactions were carried out in oven-dried glassware sealed with rubber septa under a positive pressure of dry argon. Similarly sensitive liquids and solutions were transferred via syringe. Reactions were stirred using Teflon-coated magnetic stir bars. Elevated temperatures were maintained using Thermostat-controlled silicone oil baths. Organic solutions were concentrated using a Büchi rotary evaporator with a desktop vacuum pump. Tetrahydrofuran, diethyl ether, and toluene were distilled from sodium and benzophenone prior to use. Dichloromethane was distilled from $\mathrm{CaH}_{2}$ prior to use. Dioxane (extra dry, water $<50 \mathrm{ppm}$ ) was commercially available and used as received. Synthetic reagents were purchased from Acros, Aldrich, and Alfa Aesar and used without further purification, unless otherwise indicated. Analytical TLC was performed with 0.25 mm silica gel G plates with a 254 nm fluorescent indicator. The TLC plates were visualized by ultraviolet light and treatment with phosphomolybdic acid stain followed by gentle heating. Purification of products was accomplished by flash chromatography on silica gel and the purified compounds show a single spot by analytical TLC.

NMR spectra were measured on Varian Mercury $200\left({ }^{1} \mathrm{H}\right.$ at $200 \mathrm{MHz},{ }^{13} \mathrm{C}$ at 50 MHz$)$ or Varian Mercury Plus $300\left({ }^{1} \mathrm{H}\right.$ at $300 \mathrm{MHz},{ }^{13} \mathrm{C}$ at 75 MHz$)$ nuclear magnetic resonance spectrometers. Data for ${ }^{1} \mathrm{H}$-NMR spectra are reported as follows: chemical shift (ppm, referenced to TMS; s = singlet, $\mathrm{d}=$ doublet, $\mathrm{t}=$ triplet, $\mathrm{q}=$ quartet, $\mathrm{dd}=$ doublet of doublets, $\mathrm{td}=$ triplet of doublets, $\mathrm{ddd}=$ doublet of doublet of doublets, tdd = triplet of doublet of doublets, $\mathrm{m}=$ multiplet), coupling constant (Hz), and integration. Data for ${ }^{13} \mathrm{C}-\mathrm{NMR}$ are reported in terms of chemical shift (ppm) relative to residual solvent peak $\left(\mathrm{CDCl}_{3}: 77.0 \mathrm{ppm}\right)$. Infrared spectra were recorded on an AVATAR 330 Fourier transform spectrometer (FT-IR) with an OMNI sampler and are reported in wavenumbers ( $\mathrm{cm}^{-1}$ ). Mass spectra (MS) and high-resolution mass spectra (HRMS) were recorded on a VG-ZAB-HS mass spectrometer (EI, 70 eV ).

## 2. Experimental Procedures and Characterization Data

## 3,3-Dimethylhex-5-enal (2)

To a stirred suspension of (methoxymethyl)triphenylphosphonium chloride ( $76.34 \mathrm{~g}, 223 \mathrm{mmol}$ ) in 350 mL of anhydrous THF was slowly added a solution of $\mathrm{KOBu}^{t}(26.09 \mathrm{~g}, 233 \mathrm{mmol})$ in THF $(300 \mathrm{~mL})$ at $0^{\circ} \mathrm{C}$ via cannula under argon. The resulting cherry-red solution was stirred at $0^{\circ} \mathrm{C}$ for another 1 h . A solution of 2,2-dimethylpent-4-enal ( $\mathbf{1}, 14.01 \mathrm{~g}, 125 \mathrm{mmol}$ ) in THF ( 100 mL ) was added dropwise within 20 min , and the resulting mixture was stirred at $20^{\circ} \mathrm{C}$ for 2 h . The reaction was quenched by addition of water ( 10 mL ) and the reaction mixture turned from light cherry-red to yellow. The reaction mixture was evaporated under reduced pressure in a water bath $\left(35^{\circ} \mathrm{C}\right)$ to a volume of ca. 300 mL , then aqueous $30 \% \mathrm{H}_{2} \mathrm{SO}_{4}(60 \mathrm{~mL})$ was added at room temperature under stirring. When GC indicated the disappearance of the enol ether, saturated $\mathrm{NaHCO}_{3}(200 \mathrm{~mL})$ was added. The reaction mixture was extracted with ether and the combined organic extract was washed with water, dried over $\mathrm{MgSO}_{4}$, and concentrated to give a light yellow oil. Flash column chromatography on silica gel (eluted with pentane/ether 30:1) gave aldehyde $2(10.66 \mathrm{~g}, 68 \%)$ as a colorless oil. Spectroscopic data of 2 was identical to that reported. ${ }^{[1]}$

## (E)-(4,4-dimethylhepta-1,6-dienyl)cyclopropane (3)

To a stirred suspension of (cyclopropylmethyl)triphenylphosphonium bromide ( $3.58 \mathrm{~g}, 9 \mathrm{mmol}$ ) in 40 mL of anhydrous THF was slowly added a solution of ${ }^{\mathrm{n}} \mathrm{BuLi}(3.8 \mathrm{~mL}, 2.5 \mathrm{M}, 9.5 \mathrm{mmol})$ at $0^{\circ} \mathrm{C}$ via cannula under argon. The resulting cherry-red solution was stirred at $0^{\circ} \mathrm{C}$ for another 30 min. A solution of 3,3-Dimethylhex-5-enal ( $2,990 \mathrm{mg}, 6 \mathrm{mmol}$ ) in THF ( 10 mL ) was added dropwise within 10 min , and the resulting mixture was stirred at $0{ }^{\circ} \mathrm{C}$ for 4 h . The reaction was quenched by addition of saturated aqueous solution of ammonium chloride ( 6 mL ) and the reaction mixture turned from light cherry-red to light yellow. The reaction mixture was evaporated under reduced pressure in a water bath $\left(15^{\circ} \mathrm{C}\right)$ to a volume of ca. 10 ml . The mixture was diluted with ether, washed successively with brine, dried over $\mathrm{MgSO}_{4}$, and concentrated. The crude product was purified by flash column chromatography on silica gel (eluted with pure petroleum ether $30-60^{\circ} \mathrm{C}$ ) to afford 3 ( $Z / E=2: 1$, determined by GC) as a colorless oil ( $1.16 \mathrm{~g}, 90 \%$ ).
