## 1. General

Air and moisture sensitive reactions were carried out in oven-dried glassware sealed with rubber septa under a positive pressure of dry argon. Similarly sensitive liquids and solutions were transferred via syringe. Reactions were stirred using Teflon-coated magnetic stir bars. Elevated temperatures were maintained using Thermostat-controlled silicone oil baths. Organic solutions were concentrated using a Büchi rotary evaporator with a desktop vacuum pump. Tetrahydrofuran and toluene were distilled from sodium and benzophenone prior to use. 1,2-Dichloroethane was distilled from $\mathrm{CaH}_{2}$ prior to use. 1,1,2,2-tetrachloroethane was dried over anhydrous $\mathrm{K}_{2} \mathrm{CO}_{3}$ and distilled prior to use. Dioxane (extra dry, water $<50 \mathrm{ppm}$ ) was commercially available and used as received. Synthetic reagents purchased from Acros and Alfa Aesar were used without further purification, unless otherwise indicated. Analytical TLC was performed with 0.25 mm silica gel G plates containing a 254 nm fluorescent indicator. The TLC plates were visualized by ultraviolet light and treatment with phosphomolybdic acid stain followed by gentle heating. Purification of products was accomplished by flash column chromatography on silica gel and the purified compounds show a single spot by analytical TLC.

NMR spectra were measured on Varian Mercury Plus $300\left({ }^{1} \mathrm{H}\right.$ at $300 \mathrm{MHz},{ }^{13} \mathrm{C}$ at 75 MHz$)$ or Bruker ARX400 ( ${ }^{1} \mathrm{H}$ at $400 \mathrm{MHz},{ }^{13} \mathrm{C}$ at 100 MHz$)$ nuclear magnetic resonance spectrometers. Data for ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectra are reported as follows: chemical shift (ppm, referenced to TMS; s $=$ singlet, $\mathrm{d}=$ doublet, $\mathrm{t}=$ triplet, $\mathrm{dt}=$ doublet of triplets, $\mathrm{tt}=$ triplet of triplets, $\mathrm{m}=$ multiplet $)$, coupling constant $(\mathrm{Hz})$, and integration. Data for ${ }^{13} \mathrm{C}-\mathrm{NMR}$ are reported in terms of chemical shift $(\mathrm{ppm})$ relative to residual solvent peak $\left(\mathrm{CDCl}_{3}: 77.0 \mathrm{ppm}, d_{6}\right.$-DMSO: 39.5 ppm ). Infrared spectra were recorded on an AVATAR 330 Fourier transform spectrometer (FT-IR) with an OMNI sampler and are reported in wavenumbers $\left(\mathrm{cm}^{-1}\right)$. Mass spectra (MS) and high-resolution mass spectra (HRMS) were recorded on Waters micromass GCT (EI, 70 eV ) and Bruker APEX IV (ESI) mass spectrometers.

## 2. Experimental procedures and characterization data

### 2.1 Synthesis of alkynylcyclopropanes

Alkynylcyclopropanes $\mathbf{1 a}-\mathbf{1 0}$ and $\mathbf{1 v}-\mathbf{1 x}$ were prepared by following the reported Sonogashira cross-coupling procedures. And $\mathbf{1 a}{ }^{1}, \mathbf{1 b}^{1,2}, \mathbf{1} \mathbf{c}^{1}$, and $\mathbf{1} \mathbf{e}^{1}$ are known compounds. $\mathbf{1 t}$ and $\mathbf{1 u}$ are also known compounds, which were prepared by following the literature procedures. ${ }^{2}$

General Sonogashira procedure for the preparation of aryl alkynylcyclopropanes: $\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{4}$ $(0.10 \mathrm{mmol})$ and $\mathrm{CuI}(0.20 \mathrm{mmol})$ were dissolved in 30 mL dry THF at room temperature under argon atmosphere. Then aryl iodide $(10 \mathrm{mmol}),(i-\operatorname{Pr})_{2} \mathrm{NH}(15 \mathrm{mmol})$, and cyclopropylacetylene ( 11 mmol ) was added successively. The reaction was stirred at room temperature and a brown precipitate appeared. When TLC indicated the reaction was complete, the reaction mixture was filtered through a thin pad of neutral $\mathrm{Al}_{2} \mathrm{O}_{3}$. The filter cake was washed with $\mathrm{Et}_{2} \mathrm{O}$ and the combined filtrate was concentrated. The crude product was purified by flash column chromatography on silica gel (eluted with PE) to afford the corresponding alkynylcyclopropane.

To a solution of $\mathrm{ZnEt}_{2}$ ( 1 M hexane solution, $26 \mathrm{~mL}, 26 \mathrm{mmol}$ ) in 100 mL dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ at $-10{ }^{\circ} \mathrm{C}$ was added dropwise $\mathrm{CH}_{2} \mathrm{I}_{2}(13.0 \mathrm{~g}, 49 \mathrm{mmol})$. The resulting solution was stirred at that temperature for 15 min and a white precipitate was formed. Then the alcohol $\mathbf{S 1}(2.37 \mathrm{~g}, 20.7$ $\mathrm{mmol})$ and $\mathrm{Ti}\left(\mathrm{O}^{i} \operatorname{Pr}\right)_{4}(0.35 \mathrm{~g}, 1.2 \mathrm{mmol})$ were added successively. The reaction mixture was warmed to room temperature and stirred over night. The reaction was quenched with saturated aqueous $\mathrm{NH}_{4} \mathrm{Cl}$ and extracted with $\mathrm{Et}_{2} \mathrm{O}$. The combined organic phase was washed with brine and dried over anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$. The solvent was evaporated. The crude product was purified by flash column chromatography on silica gel (eluted with $\mathrm{PE} / \mathrm{AE}=4: 1$ ) to afford alcohol S 2 as a colorless oil ( $2.15 \mathrm{~g}, 81 \%$ ).

### 2.3 General procedure for the ring expansion reaction

$\mathrm{AuPPh}_{3} \mathrm{Cl}(12 \mathrm{mg}, 0.025 \mathrm{mmol}, 5 \mathrm{~mol} \%$ ) and $\mathrm{AgOTf}(6 \mathrm{mg}, 0.025 \mathrm{mmol}, 5 \mathrm{~mol} \%)$ were mixed in 1 mL dry DCE (or TCE) under argon atmosphere. The mixture was stirred at room temperature (or $80^{\circ} \mathrm{C}$, TCE as solvent) for 30 min with sufficient precipitation of AgCl , and then was added to a solution of alkynylcyclopropane derivative ( 0.5 mmol ) and sulfonamide ( 0.6 mmol ) in 4 mL dry DCE (or TCE). The resulting mixture was heated at the indicated temperature. When TLC indicated the disappearance of the alkynylcyclopropane derivative, the reaction mixture was cooled to room temperature and purified by flash column chromatography on silica gel (eluted with PE to $\mathrm{PE} / \mathrm{EA}=7: 1$ ) to afford the corresponding alkylidenecyclobutyl sulfonamide product. All the products were assigned to have an E-olefinic configuration by compared to product $\mathbf{3 h}$, which was determined by X-ray crystallographic analysis.
