## 1. General

Air and moisture sensitive reactions were carried out in oven-dried glassware sealed with rubber septa under a positive pressure of dry argon. Similarly sensitive liquids and solutions were transferred via syringe. Reactions were stirred using Teflon-coated magnetic stir bars. Elevated temperatures were maintained using Thermostat-controlled silicone oil baths. Organic solutions were concentrated using a Büchi rotary evaporator with a desktop vacuum pump. Tetrahydrofuran, diethyl ether, and toluene were distilled from sodium and benzophenone prior to use. Dichloromethane was distilled from $\mathrm{CaH}_{2}$ prior to use. Dichloroethane was distilled from $\mathrm{P}_{2} \mathrm{O}_{5}$ prior to use. Synthetic reagents were purchased from Acros, Aldrich, and Alfa Aesar and used without further purification, unless otherwise indicated. Analytical TLC was performed with 0.25 mm silica gel G plates with a 254 nm fluorescent indicator. The TLC plates were visualized by ultraviolet light and treatment with phosphomolybdic acid stain followed by gentle heating. Purification of products was accomplished by flash chromatography on silica gel and the purified compounds showed a single spot by analytical TLC.

NMR spectra were measured on Varian Mercury Plus $300\left({ }^{1} \mathrm{H}\right.$ at $300 \mathrm{MHz},{ }^{13} \mathrm{C}$ at 75.5 MHz ), Bruker ARX $400\left({ }^{1} \mathrm{H}\right.$ at $400 \mathrm{MHz},{ }^{13} \mathrm{C}$ at 100 MHz$)$, and Bruker AVANCE $600\left({ }^{1} \mathrm{H}\right.$ at $600 \mathrm{MHz},{ }^{13} \mathrm{C}$ at 150 MHz$)$ nuclear magnetic resonance spectrometers. Data for ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectra are reported as follows: chemical shift (ppm, referenced to TMS; $\mathrm{s}=$ singlet, $\mathrm{d}=$ doublet, $\mathrm{t}=$ triplet, $\mathrm{q}=$ quartet, $\mathrm{dd}=$ doublet of doublets, $\mathrm{dt}=$ doublet of triplets, $\mathrm{dm}=$ doublet of multiplet, $\mathrm{ddd}=$ doublet of doublet of doublets, $\mathrm{tdd}=$ triplet of doublet of doublets, $\mathrm{m}=$ multiplet), coupling constant ( Hz ), and integration. Data for ${ }^{13} \mathrm{C}-\mathrm{NMR}$ are reported in terms of chemical shift ( ppm ) relative to residual solvent peak $\left(\mathrm{CDCl}_{3}: 77.0 \mathrm{ppm}\right)$. 1 D nOe experiments were conducted on a Bruker AVANCE 600 nuclear magnetic resonance spectrometer. Infrared spectra were recorded on Mettler-Toledo ReactIR iC10 system with a SiComp probe and are reported in wavenumbers $\left(\mathrm{cm}^{-1}\right)$. High-resolution mass spectra (HRMS) were recorded on a Bruker Apex IV FTMS mass spectrometer (ESI).

A solution of diester $7(12.55 \mathrm{~g}, 67.4 \mathrm{mmol})$ in anhydrous $\mathrm{CH}_{2} \mathrm{Cl}_{2}(140 \mathrm{~mL})$ was cooled to $-78^{\circ} \mathrm{C}$ under argon. To the stirred solution DIBAL-H ( $140 \mathrm{~mL}, 1 \mathrm{M}$ in hexane, 140 mmol ) was slowly added, maintaining the inner temperature below $-70^{\circ} \mathrm{C}$. Then the reaction mixture was stirred for 30 min . Acetone ( 10 mL ) was added dropwise to quench the reaction, keeping the inner temperature below $-60^{\circ} \mathrm{C}$. Then aqueous $\mathrm{HCl}(120 \mathrm{~mL}, 2 \mathrm{M})$ was added and the reaction mixture was allowed to warm to room temperature. Concentrated aqueous HCl was added until a clear solution formed. The organic phase was separated, and the aqueous phase was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The combined organic phase was washed with saturated aqueous potassium sodium tartrate, dried over $\mathrm{MgSO}_{4}$, and concentrated. Comparison of the ${ }^{1} \mathrm{H}$ NMR spectrum indicates that the minor isomer 13a has the correct relative configuration.

[^0]:    (1) The assignment of the relative configuration of cycloadducts $\mathbf{1 3 a}$ and $\mathbf{1 3 b}$ was achieved by oxidation of the stereochemically well-defined compound 16a and comparison of the product's ${ }^{1} \mathrm{H}$ NMR spectrum with that of 13a and 13b mixture. Oxidation of compound 16a by $\mathrm{K}_{2} \mathrm{OsO}_{4}-\mathrm{NaIO}_{4}$ gave 13a, indicating that it has identical relative configuration to the natural product.
