3. ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$-NMR Spectra for New Compounds .................................................. S10
4. HPLC Diagrams for Enantiomeric Purity Determination.................................... S23
5. Nonlinear Effect Study of the Standard Reaction ................................................ S60

## 1. General

Air and moisture sensitive reactions were carried out in oven-dried glassware sealed with rubber septa under a positive pressure of dry argon. Similarly sensitive liquids and solutions were transferred via syringe. Reactions were stirred using Teflon-coated magnetic stir bars. Elevated temperatures were maintained using Thermostat-controlled silicone oil baths. Organic solutions were concentrated using a Büchi rotary evaporator with a desktop vacuum pump. Dioxane and synthetic reagents were purchased from Acros, Aldrich, and Alfa Aesar and used without further purification, unless otherwise indicated. Analytical TLC was performed with 0.25 mm silica gel G plates with a 254 nm fluorescent indicator. The TLC plates were visualized by ultraviolet light and treatment with phosphomolybdic acid stain followed by gentle heating. Purification of products was accomplished by flash chromatography on silica gel and the purified compounds show a single spot by analytical TLC.

NMR spectra were measured on Bruker ARX $400\left({ }^{1} \mathrm{H}\right.$ at $400 \mathrm{MHz},{ }^{13} \mathrm{C}$ at 100 MHz$)$ nuclear magnetic resonance spectrometers. Data for ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectra are reported as follows: chemical shift (ppm, referenced to TMS; $\mathrm{s}=$ singlet, $\mathrm{d}=$ doublet, $\mathrm{t}=$ triplet, $\mathrm{q}=$ quartet, $\mathrm{dd}=$ doublet of doublets, $\mathrm{dt}=$ doublet of triplets, ddd $=$ doublet of doublet of doublets, ddt = doublet of doublet of triplets, $m=$ multiplet $)$, coupling constant $(\mathrm{Hz})$, and integration. Data for ${ }^{13} \mathrm{C}-\mathrm{NMR}$ are reported in terms of chemical shift ( ppm ) relative to residual solvent peak ( $\mathrm{CDCl}_{3}$ : 77.0 ppm ). Infrared spectra were recorded on an AVATAR 330 Fourier transform spectrometer (FT-IR) with an OMNI sampler and are reported in wavenumbers ( $\mathrm{cm}^{1}$ ). High-resolution mass spectra (HRMS) were recorded on a Bruker Apex IV FTMS mass spectrometer (ESI). Optical rotations were measured on a Perkin-Elmer 341 LC spectrometer. The enatiomeric excesses (ee) of the products were determined by chiral HPLC analysis using Aglient HP 1100 instrument.

Abbreviations:
coe $=(Z)$-cyclooctene

## 2. Representative Procedures for the $\mathbf{R h}(\mathrm{I})$ catalyzed Conjugated Addition of Phenyl Boronic Acids to 2-cyclohexenone

To a Schlenk flask charged with phenyl boronic acid ( $60.0 \mathrm{mg}, 0.49 \mathrm{mmol}),\left[\mathrm{Rh}(\text { coe })_{2} \mathrm{Cl}\right]_{2}(6.0 \mathrm{mg}, 8.36 \mu \mathrm{~mol}$, $2.5 \mathrm{~mol} \%$ ), and chiral diene ligand $\mathbf{1 a}(94 \%$ ee, $7.0 \mathrm{mg}, 20 \mu \mathrm{~mol}, 6.0 \mathrm{~mol} \%$ ) was added degassed dioxane ( 0.9 mL ) under Argon. The resulting mixture was heated to $50^{\circ} \mathrm{C}$ and stirred for 15 min , followed by addition of 2-cyclohexenone ( $32.1 \mathrm{mg}, 0.33 \mathrm{mmol}$ ) and aq. $\mathrm{KOH}(0.033 \mathrm{mmol}, 0.075 \mathrm{M}, 0.45 \mathrm{~mL}$ ). The reaction mixture was stirred at room temperature for 2 h , solvent was removed under reduced pressure. The crude residue was purified by flash chromatography on silica gel (hexanes: ethyl acetate $=30: 1, \mathrm{v} / \mathrm{v}$ ) to give the conjugated addition product as a colorless oil ( $51.3 \mathrm{mg}, 89 \%$ yield, $91 \% \mathrm{ee}$ ).

## 5. Nonlinear Effect Study of the Standard Reaction

The reactions were done following the same procedures as stated above in the representative procedures using chiral diene ligand 1a in different ee's, which were determined by HPLC. After the completion of the reaction, the product was separated and purified by column chromatography, and the ee's of these products were also determined by HPLC analysis. The ee's of the chiral diene ligands and corresponding products were shown in the table below.

| ee of ligand | $13 \%$ | $27 \%$ | $41 \%$ | $56 \%$ | $69 \%$ | $81 \%$ | $94 \%$ | $100 \%$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| ee of product | $9 \%$ | $21 \%$ | $32 \%$ | $48 \%$ | $60 \%$ | $70 \%$ | $91 \%$ | $97 \%$ |

These date showd there was no nonliner effect in this asymmetric addition reaction:

ee of ligand (\%)
