1. Computational Methods

All DFT calculations were carried out with the Gaussian 03 program package.¹ The geometry optimizations of all the minima and transition states were performed at the B3LYP² level of theory with the 6-31G(d)³ basis set. The vibrational frequencies were computed at the same level of theory to check whether every optimized structure is an energy minimum or a transition state and to evaluate its zero-point vibration energy (ZPE). IRC calculations⁴ were carried out to confirm that each transition state is connected with its corresponding reactant and product. Solvent effects were computed with the CPCM⁵ model and UAHF radii in toluene for five-membered substrates and in dichloromethane (DCM) for six-membered ones using the gas phase optimized structures. ΔG_{sol} and ΔG_{gas} reported in this paper are relative Gibbs free energies calculated at 298K in solution and in the gas phase, respectively. ΔE_0 is the zero-point vibration energy (ZPE)-corrected electronic energy in the gas phase. All discussed energies in the paper and the Supporting Information are Gibbs free energies in solution (ΔG_{sol}) unless specified. Computed structures are illustrated using CYLVIEW drawings.⁶ We point out here that, using bigger basis set of 6-311+G(d,p) at the B3LYP level gave very close activation energies as those from B3LYP/6-31G(d), suggesting that the present system is not sensitive to the basis set used in DFT calculations (see Page S6).

2.5 Computed Activation Free Energies with Two Lewis Acids as the Possible Active Promoting Species

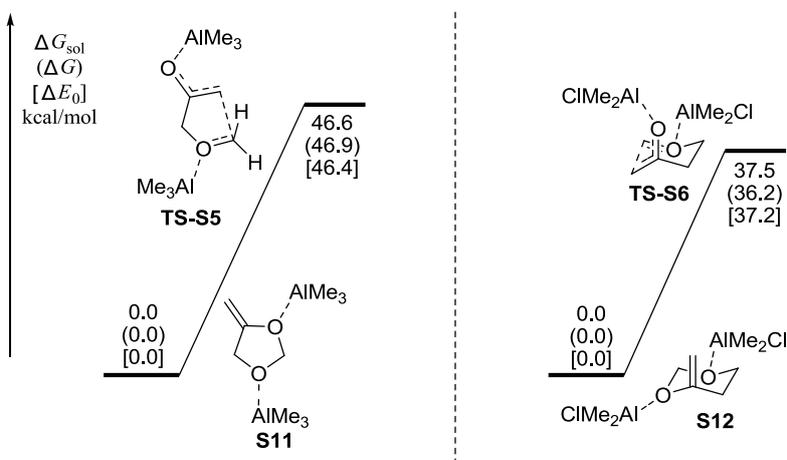

Figure S5. Activation free energies with two neutral Lewis acids as the possible active promoting species.

We have also tried to compute the activation free energies with two cationic Lewis acids as the possible active promoting species. However, one cationic Lewis acid (red part in Figure S6) always departs away in the key transition states, indicating that it is disfavored to have two cationic Lewis acids as the active promoting species in these reaction systems (Figure S6). Such two-Lewis acids systems will generate oxocarbenium enolates with two positive charges in the transition states and are disfavored.

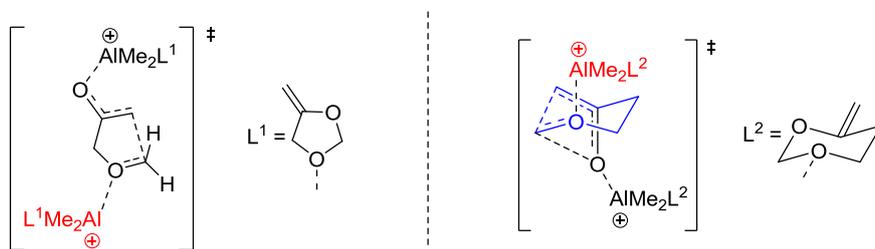

Figure S6. Expected but not located key transition states with two cationic Lewis acids as the possible active promoting species.
