1. Additional Calculation Details and Results

We computed the energy surface of **b-4** using bigger basis sets (LANL2DZ for In, and 6-311+G(d, p) for all other atoms).¹ The energy barriers and selectivity in Figure S1 were similar to those shown in Figure 2 of text. At this level, the cyclobutyl cation **b-8** was not a minimum.

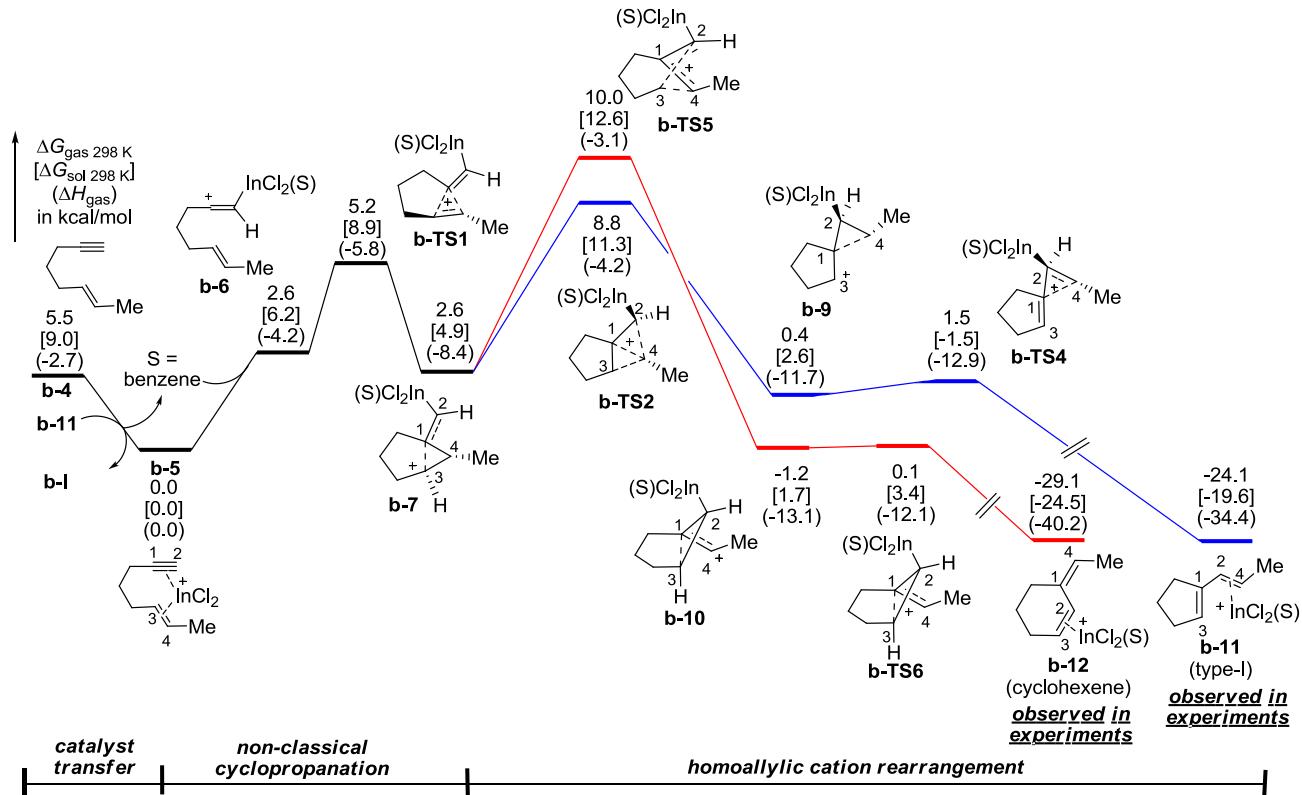

Figure S1. Full energy surface of **b-4** (LANL2DZ for In, and 6-311+G(d, p) for all other atoms)

When InCl_3 was chosen to as the catalytic species, the computed selectivities were not consistent with the experimentally observed ones, as mentioned in the text (section 5 of “Results and Discussion”). The computed energy surfaces using InCl_3 as the catalyst have been summarized in Figures S2, S3 and S4. We found that, all 6/3-bicyclic intermediates (**m-b-10**, **m-c-10**, **m-d-10**) and cyclobutyl cation **m-d-8** were not minima using InCl_3 as the catalytic species.

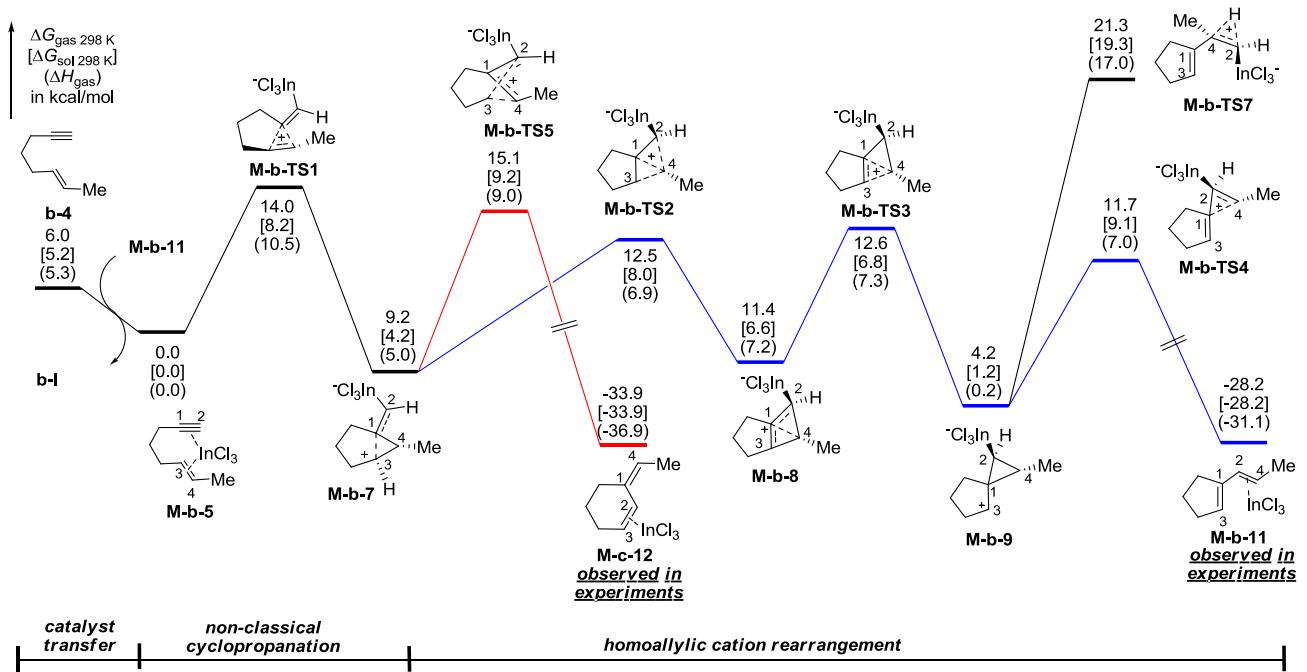

Figure S2. Full energy surface of **b-4**, taking InCl_3 as the catalyst.

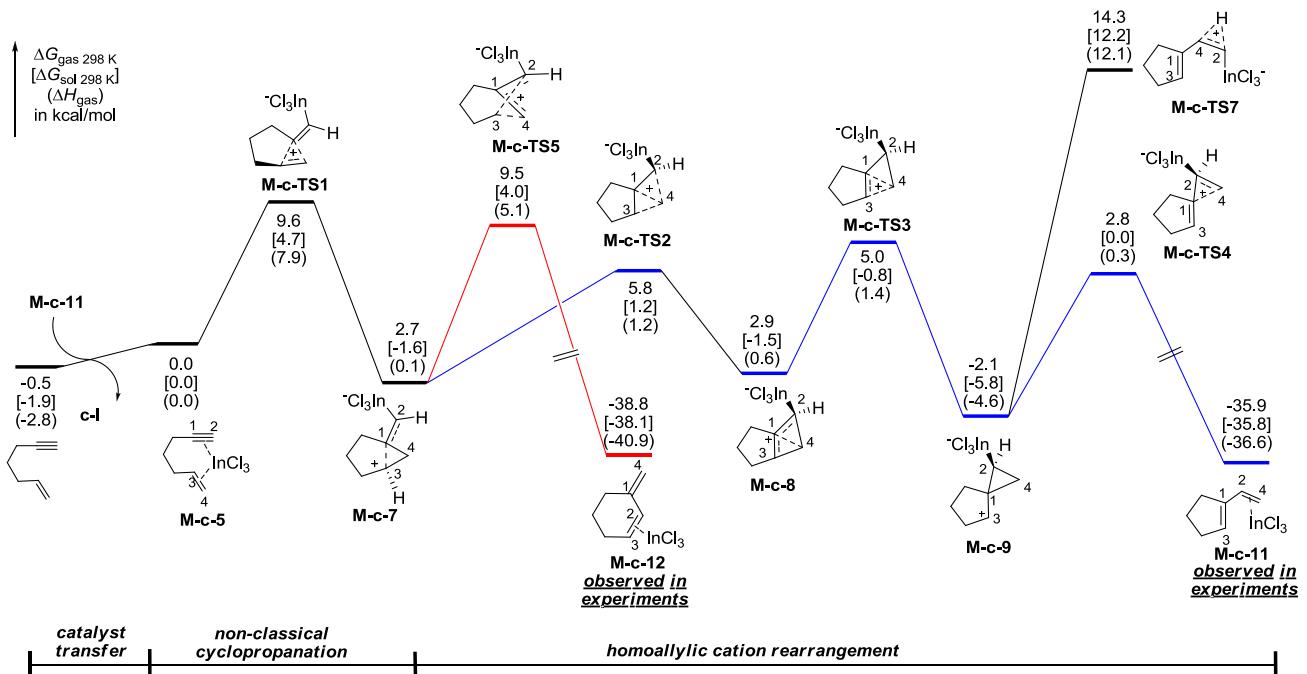

Figure S3. Full energy surface of **c-4**, taking InCl_3 as the catalyst.

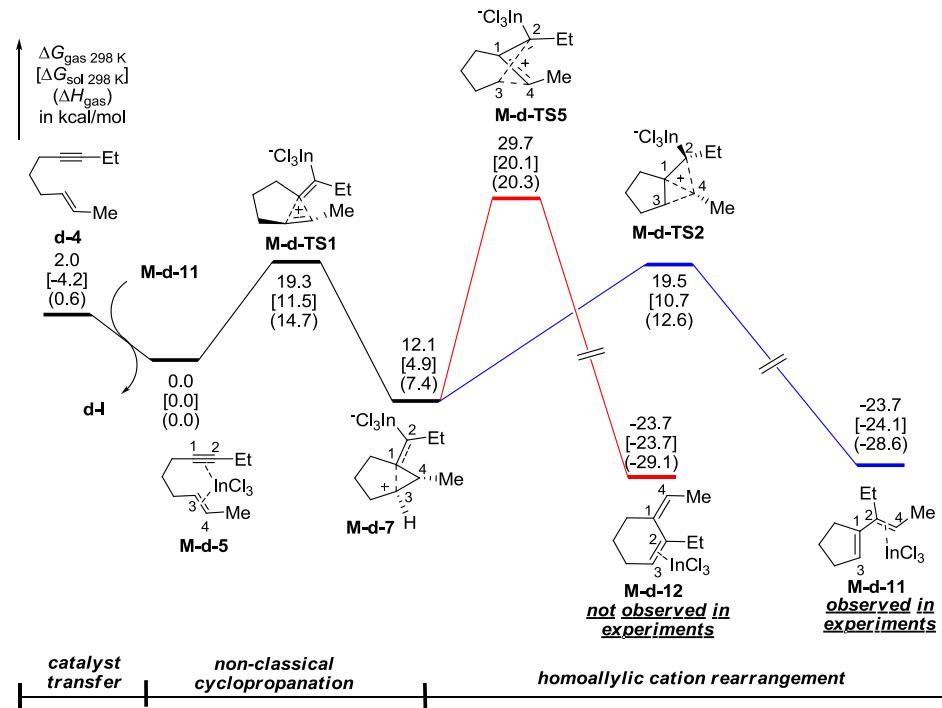

Figure S4. Full energy surface of **d-4**, taking InCl_3 as the catalyst.

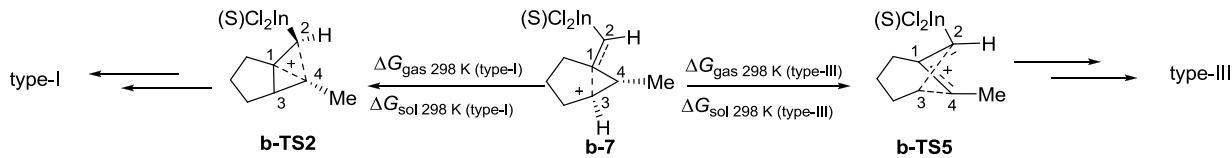

Single point energy calculations using BP86, MP2 and MPWPW91 indicated that the calculated energy barriers of cyclopropanation progress by BP86 and MPWPW91 are similar to that from B3LYP calculations, while the MP2 calculations gave higher activation energy than that from B3LYP calculations (Table S1). Calculations by BP86, MP2 and MPWPW91 suggested that a mixture of type-I and type-III dienes should be produced, which is consistent with the experimentally observed results (Table S2).

We have also included the dispersion energy in our calculations by using B3LYP-D2, M06 and M06-2X functionals. However, all of them suggested that the **TS2** was more favored than **TS5** by 3.1, 5.1 and 4.8 kcal/mol, respectively, predicting that type-III diene products should be obtained exclusively, with negligible formation of type-I dienes. These predictions disagreed with experiments. Calculations using bigger basis set (M06-2X/6-311+G(d,p)) gave results contradicting with the experimental observation (Table S2). To check whether this discrepancy was caused by the single point energy calculations using the B3LYP optimized structures, we reoptimized all stationary points in Table S2 by the M06-2X functional. It was found that the M06-2X calculated structures were very similar to those obtained from B3LYP optimizations, and the predicted selectivity by M06-2X was wrong again (**TS2** was more favored than **TS5** by 3.4 kcal/mol at this level). Based on these calculation results, we can conclude that B3LYP functional is appropriate for investigating the present system.

Table S1. Cyclopropanation progress calculated with various computational methods.

^a Single point energy was calculated using 6-31G(d) basis set based on the B3LYP/6-31G(d) optimized structures (In atom by the LANL2DZ)

^b Single point energy was calculated using 6-311+G(d,p) basis set based on the B3LYP/6-31G(d) optimized structures (In atom by the LANL2DZ)

^c The structures were optimized by the M06-2X functional using 6-31G(d) basis set (In atom by the LANL2DZ)
