1. Diastereoselectivities and regioselectivities of DMSM derivatives toward enones

For **Ar-DMSM**, two competing pathways of cyclopropanation are shown in **Figure S1**, the rate determining transition states **TS9-1** and **TS9-2** are close in energy, and subsequent nucleophilic substitutions via **TS10-1** and **TS10-2** give the cyclopropanation products **Ar-PR1-1** and **Ar-PR1-2**. These calculations suggest that, the reaction would give a mixture of both cyclopropane products. These calculation results agree with experimental observations.^[1]

The potential energy surfaces of two competing pathways of epoxidation for **Ar-DMSM** are shown in **Figure S2**. The epoxidations having activation free energies of 27.7 and 30.0 kcal/mol are not favored compared to cyclopropanations, agreeing with experiments.

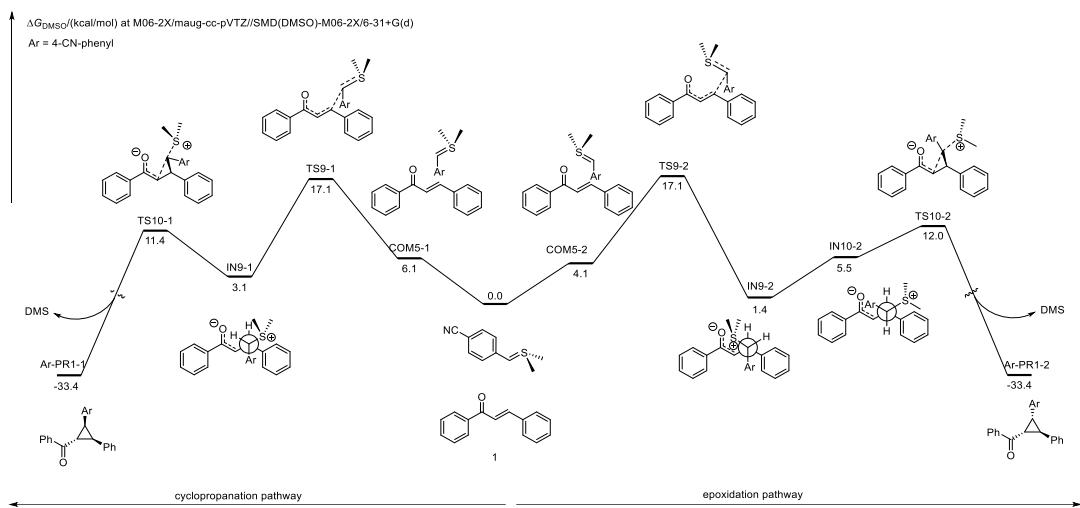

Figure S1. DFT computed energy surfaces of cyclopropanation reactions of **Ar-DMSM** with enone

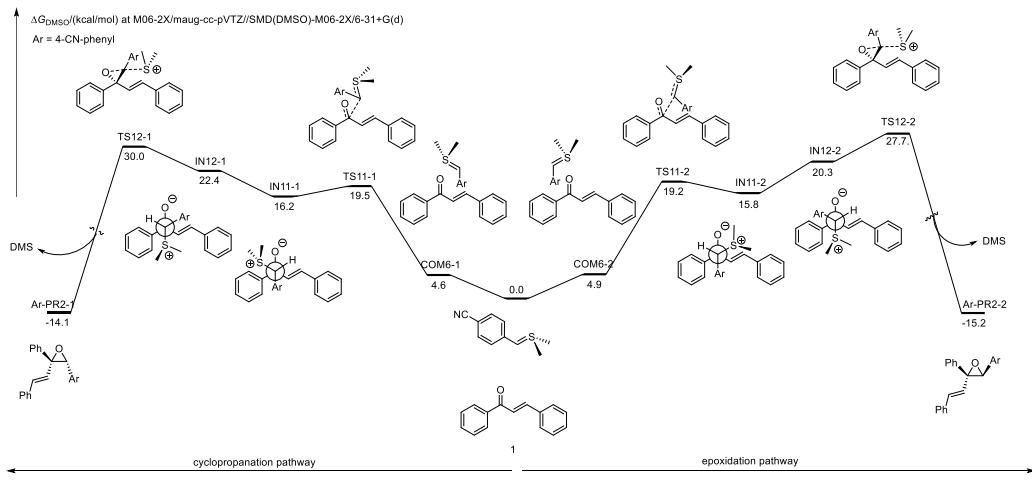

Figure S2. DFT computed energy surfaces of epoxidation reactions of **Ar-DMSM** with enone

For **E-DMSM**, two competing pathways of cyclopropanation are shown in **Figure S3**. In the rate determining step, **TS13-1** is 0.4 kcal/mol higher than **TS13-2** in energy, and subsequent nucleophilic substitutions via **TS14-1** and **TS14-2** give the cyclopropane products **E-PR1-1** and **E-PR1-2**. Therefore, the reaction would give a mixture of both cyclopropane products. These calculation results are in agreement with experimental observations.^[2]

Two competing pathways of epoxidation are shown in **Figure S4**. The epoxidations having activation free energies of 34.0 and 35.5 kcal/mol are not favored compared to cyclopropanations, agreeing with experiments.

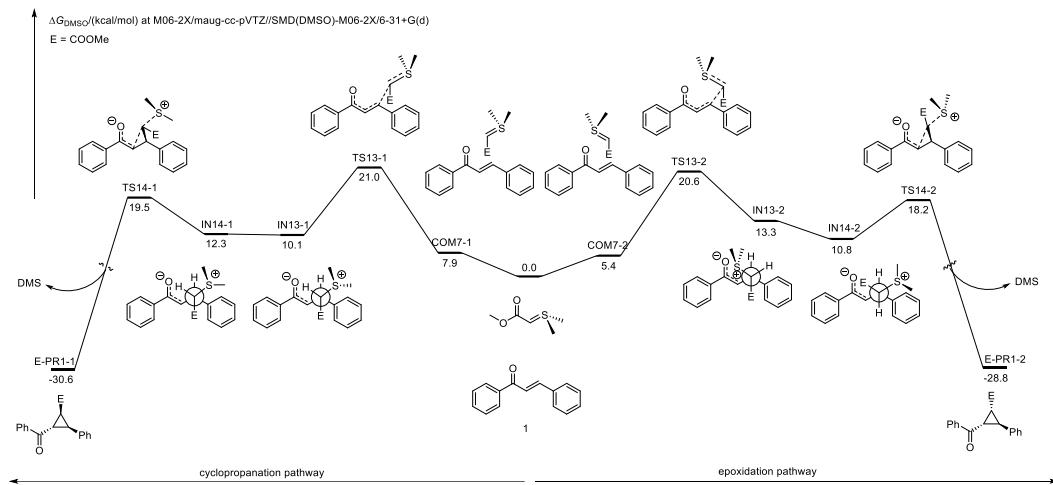

Figure S3. DFT computed energy surfaces of cyclopropanation reactions of **E-DMSM** with enone

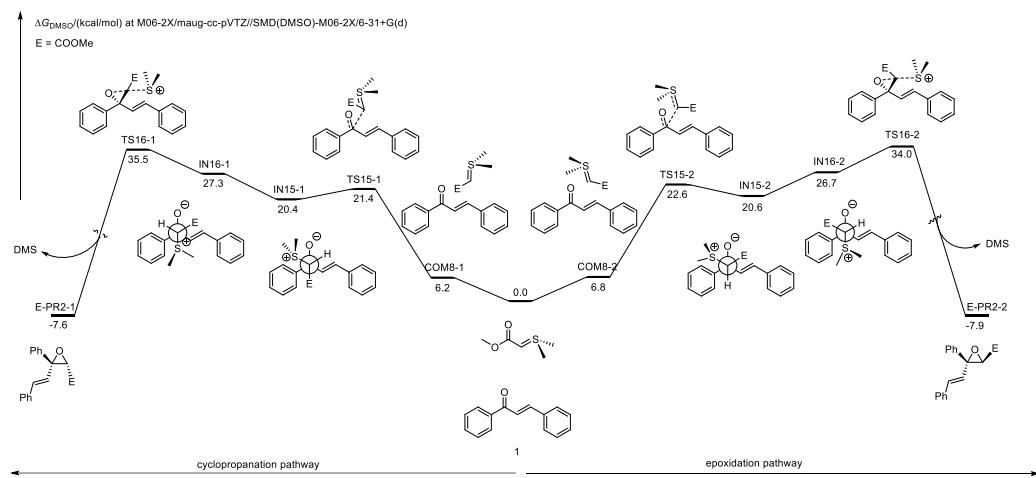

Figure S4. DFT computed energy surfaces of epoxidation reactions of **E-DMSM** with enone

2. Discussion on solvation effects

It is shown here (Figure S5) that the computed potential energy surfaces at the SMD(DMSO)-M06-2X/maug-cc-pVTZ//SMD(DMSO)-M06-2X/6-31+G(d) level are similar to those from M06-2X/maug-cc-pVTZ//SMD(DMSO)-M06-2X/6-31+G(d) (which used in the main text of this paper, Figure 1). Therefore calculations at M06-2X/maug-cc-pVTZ//SMD(DMSO)-M06-2X/6-31+G(d) level were used in order to reduce the computing times at SMD(DMSO)-M06-2X/maug-cc-pVTZ//SMD(DMSO)-M06-2X/6-31+G(d) level. The computed activation free energies are close to 16.6 kcal/mol measured experimentally (this value is computed based on the relative reaction rate of DMSOM toward *trans*-PhCH=CHCOPh and *trans*-PhCH=CHCOCH₃, the latter reaction had a measured activation free energy of 18.4 kcal/mol).^[3]

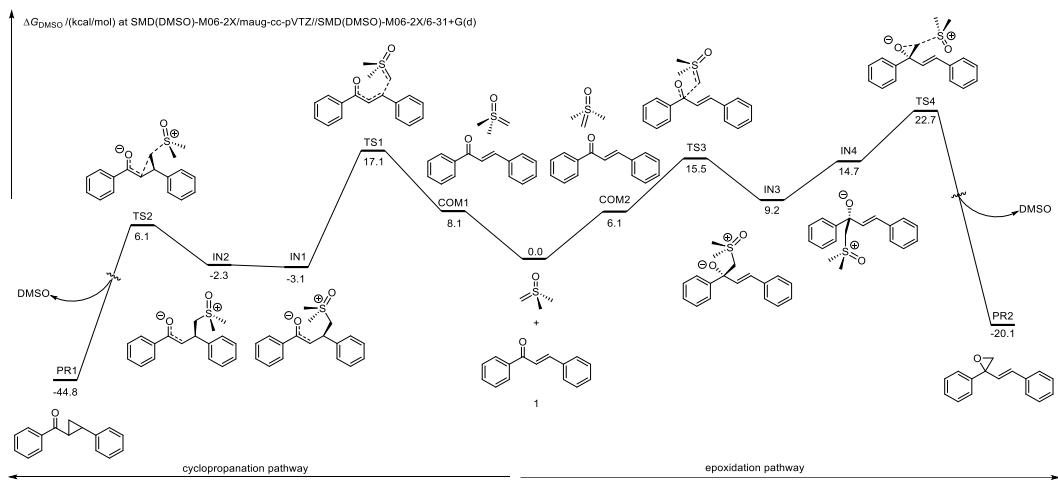

Figure S5. DFT computed energy surfaces at SMD(DMSO)-M062X/maug-cc-pVTZ// SMD(DMSO)-M062X/6-31+G(d)

We point out here that our calculation methods (low level geometry optimization in solvent, and high level gas phase calculations to obtain free energies in solutions) at M06-2X/maug-cc-pVTZ//SMD(DMSO)-M06-2X/6-31+G(d) level can help us roughly appreciate how solvent affects each step. For example, we present the free energy surfaces in both DMSO and gas phase together, for both ylides' reactions with enone (Figures S6 and S7) and we can see that, high-dielectric constant solvent DMSO influences the shapes of energy surfaces significantly. Especially DMSO is found to stabilize the zwitterionic species dramatically and this can promote the epoxidation reaction pathways significantly. Here we use an assumption that the thermal corrections to Gibbs free energy computed in solution phase are close to those from gas phase calculations.

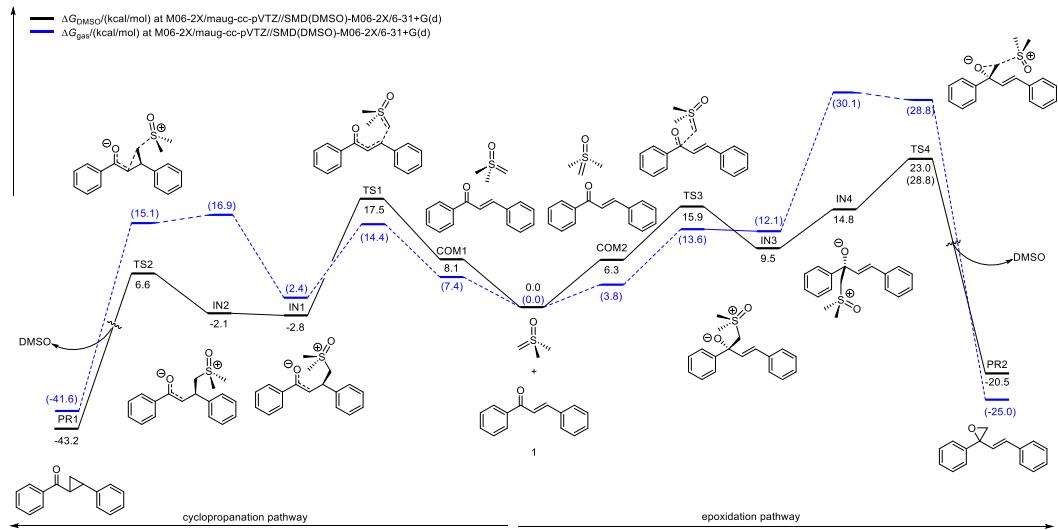

Figure S6. Comparison of gas-phase and sol-phase energy surfaces for **DMSOM** with enone

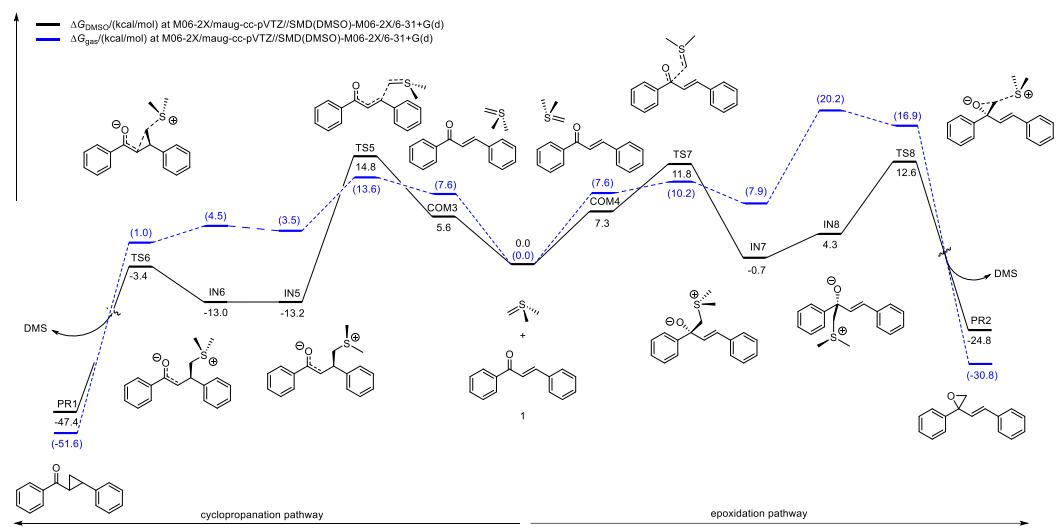

Figure S6. Comparison of gas-phase and sol-phase energy surfaces for **DMSM** with enone
